

# The Space of All Stereo Images

Steve Seitz  
University of Washington

## Stereo Imaging

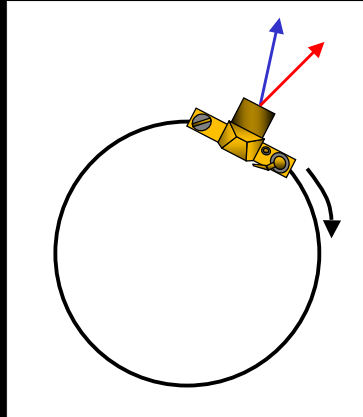

**Key property: horizontal parallax**

- Enables stereoscopic viewing and stereo algorithms
- Gives rise to epipolar geometry

**What other image varieties have this property?**

## Stereo Panoramas

- [Ishiguro, Yamamoto, Tsuji, 92]
- [Peleg and Ben-Ezra, 99]
- [Shum, Kalai, Seitz, 99]
- [Nayar and Karmarkar, 00]

I

## Problem Statement

Suppose you could capture *any* set of rays

- Which rays result in a stereo pair?
  - satisfy **horizontal parallax** constraint
- How to define epipolar geometry?
- How to express projection, triangulation?

## Geometry of Stereo Panoramas

## Geometry of Stereo Panoramas

## Epipolar Geometry

## Stereo Classification Theorem

Two images form a stereo pair iff

- Each row lies on a doubly ruled surface
- Corresponding rows are the same surface

There are only 3 doubly-ruled surfaces

⇒ Extension of classical result [Hilbert]

# Generating Stereo Views

## Recipe book for stereo views

- All stereo pairs are generated by moving a camera along a **conic** curve
  - line, ellipse, parabola, hyperbola

image representation	generator	epipolar surface
perspective	point	pencil of planes
stereo panorama [YT 92], [PB 99], [SKS 99]	circle	half-hyperboloids
omnivergent, $360 \times 360$ [SKS 99], [NK 00]	circle	hyperboloids
spherical omnivergent [SKS 99]	sphere	pencil of planes
pushbroom stereo	line	pencil of planes
stereo cyclograph	ellipse	half-hyperboloids
parabolic panorama	parabola	hyperbolic paraboloids

## Pushbroom Stereo

## Parabolic Panorama

perspective image

parabolic panorama

## Stereo Cyclographs

input

cyclographs

## Stereo Cyclograph Reconstruction

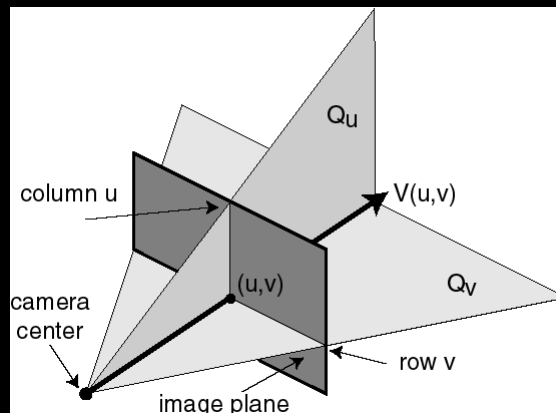

Computed from two cyclograph images

- Using unmodified stereo matcher [Zitnick & Kanade]

## Mathematics for Stereo Views

Defined by two families of quadric surfaces

- Rays in row  $u$  lie on quadric  $Q_u$
- Rays in column  $v$  lie on quadric  $Q_v$

# Mathematics for Stereo Views

## Projection

- Solve for  $u, v$ , given  $X$

$$\begin{aligned} X^T Q_v X &= 0 \\ X^T Q_u X &= 0 \end{aligned}$$

## Triangulation

- Solve for  $X$ , given  $u_1, u_2, v$

$$\begin{aligned} X^T Q_v X &= 0 \\ X^T Q_{u_1} X &= 0 \\ X^T Q_{u_2} X &= 0 \end{aligned}$$

## Unified treatment for all stereo varieties

- Reduces to standard eqns for the perspective case

# Conclusions

## Main results

- Stereo Classification Theorem
- Recipe book for generating stereo pairs
- Mathematics of stereo imaging

## Future work

- Exploring interesting new varieties
- Multiperspective camera design
- Multiperspective image analysis
